E. YILDIRIM & J. GUSENLEITNER

A b s t r a c t : This study is based upon material of family Vespidae collected from different localities of Turkey between 2005 and 2006, and the other related studies on the Vespidae in Turkey were reviewed. Including the new taxa determined in this study a total of 298 species and subspecies from 52 genera were recorded from Turkey up to now. *Stenodynerus pullus* GUSENLEITNER 1981 is new record for Turkish fauna. In addition, new localities have been found for some species and subspecies which have already been reported in Turkey

Introduction

Total 291 species and subspecies belonging to 52 genera of Vespidae were recorded from Turkey (YILDIRIM & GUSENLEITNER 2004).

GUSENLEITNER (2004) described *Pterocheilus multimaculatus* from Nevşehir, *Brachyodynerus chloroticus* from Kars (Kağızman) and *Brachypipona orientalis* from Sivas (Gürün); GUSENLEITNER (2006) recorded *Microdynerus urdunus* GUSENLEITNER 2004 from Bitlis (Tatvan) and described *Cyrtolabulus anatolicus* GUSENLEITNER 2006 from Mardin, *C. mutinensis* GUSENLEITNER 2006 from İçel (Mut, Setavul), *C. yildirimi* GUSENLEITNER 2006 from Hakkari (Beytüşşebap, Habur Deresi) in Turkey. Separately, GUSENLEITNER 2006 recorded *Leptochilus micans* GIORDANI SOIKA 1986 as a synonym of *Microdynerus nugdunensis* (SAUSSURE 1856)

In this study, the present situation of Vespidae species and subspecies of Turkey is evaluated. Including the new taxa determined in this study a total of 298 species and subspecies belonged to 52 genera from family Vespidae were recorded from Turkey up to now.

The material of the Vespidae was collected from different localities of Turkey in 2005-2006. Provinces of the collected specimens are given in alphabetical order in the following list. The material is deposited in the Entomology Museum, Erzurum, Turkey (EMET).
